### Contents

#### Editorial
35  Exciting times ahead for EBN

#### Research made simple
36  Hypothesis testing and p values: how to interpret results and reach the right conclusions

#### Women’s health
38  Overweight and obese middle-aged women have increased risk of venous thromboembolism, particularly following surgery

#### Midwifery
40  Women who receive continuous support during labour have reduced risk of caesarean, instrumental delivery or need for analgesia compared to usual care
41  Diet and physical activity interventions reduce pregnancy weight gain compared with control, with dietary interventions having the greatest effect
43  Excess maternal weight gain during pregnancy is associated with overweight/obesity in offspring at age 16 years, but maternal pre-pregnancy obesity has a greater effect

#### Mental health
45  Tailoring and targeting interventions for women with heart disease: the need for gender-based approaches

#### Adult nursing
47  A depression screening tool finds that 54% of acute cardiac patients are at risk of depression; use of the tool improves documentation and referral
48  A three-step critical pathway for community-acquired pneumonia reduces duration of hospital stay and intravenous antibiotic use by 2 days

#### Child health
50  Essential information about patterns of victimisation among children with disabilities
51  Sleep position does not appear to influence the risk of extreme cardiorespiratory events in vulnerable infants

#### Health promotion
53  In smokers who lapse during nicotine patch treatment, continued patch use increases the likelihood of recovering abstinence

#### Primary healthcare
55  Low-dose aspirin is associated with an increased risk of haemorrhage; but not in people with diabetes who have a high baseline rate of bleeding
56  Orlistat reduces weight but its cost–effectiveness remains unclear

#### Pain management
58  Intravenous analgesia for out-of-hospital traumatic pain in adults: ketamine gives a greater reduction in pain than morphine but causes more adverse effects

#### Nursing issues
60  Study of 23 advanced-practice nurses suggest that their ability to facilitate evidence-based practice among frontline nurses is influenced by their personal attributes, relationships with stakeholders, responsibility and workload and organisational context
61  One-on-one education and client reminders increase uptake of colorectal, breast and cervical cancer screening
62  Higher nurse staffing levels associated with reductions in unplanned readmissions to intensive care or operating theatre, and in postoperative in-hospital mortality in heart surgery patients
64  Asking next-of-kin of recently deceased cancer patients to take part in research: 11 of 20 surveyed found it a positive experience

#### Care of older people
66  Among elderly men, feelings of loneliness are associated with increased 10-year mortality risk, independent of social isolation and medical and psychiatric conditions
67  Community-based non-pharmacological interventions delivered by family caregivers reduce behavioural and psychological symptoms of dementia

#### Miscellaneous
68  Correction
