Editorial

- 33 Election 2015: making sure your voice is heard

Research made simple

- 34 Issues of validity and reliability in qualitative research

Women's health

- 36 Sixteen per cent of women have depression symptoms in the year after childbirth and are more likely to report physical symptoms, including tiredness and back pain

Midwifery

- 37 Maternal extraversion, emotional stability and conscientiousness are associated with initiation and continuation of breastfeeding
- 38 Of women seeking assistance for intimate partner violence, those who report victimisation during pregnancy are at higher risk of further victimisation
- 39 Pregnant women with schizophrenia are at higher risk of pre-eclampsia, venous thromboembolism and adverse neonatal outcomes

Adult nursing

- 41 Fasting may not be required before percutaneous coronary intervention
- 42 A decision tree incorporating biomarkers and patient characteristics estimates mortality risk for adults with septic shock
- 43 Addressing anxiety and insecure attachment in close relationships could improve quality of life for gynaecological cancer survivors
- 44 Higher red meat intake in early adulthood is associated with increased risk of breast cancer; substitution with different protein sources such as legumes and poultry may help

Child health

- 45 High consumption of peanuts or tree nuts by non-allergic mothers around the time of pregnancy reduces the risk of nut allergy in the child
- 46 Low parent health literacy is associated with 'obesogenic' infant care behaviours
- 47 Half of parents underestimate the weight of their overweight or obese children
- 48 Cumulative adversity in early childhood is associated with increased BMI and behavioural problems

April 2015 Vol 18 No 2

- 50 Nurse home visits for infants and toddlers of low-income families improve behavioural, language and attention outcomes at age 6–9 years; paraprofessional visits improve visual attention and task switching
- 52 Individualised education reduces anxiety levels in children over 4 years undergoing elective surgery
- 53 Adoptive parents can be unprepared for the challenges in caring for children with reactive attachment disorder
- 54 Children with poor adherence to antiepileptic drugs during the first 6 months of treatment are less likely to be seizure free after 4 years

Primary healthcare

- 55 Poor quality evidence to support the use of biofeedback for the treatment of functional constipation in adults
- 56 A nurse-led email reminder programme on healthy lifestyle can improve cardiovascular risk factors in hypertensive adults

Pain management

- 57 Review: femoral nerve block may be the most effective option for pain relief following total knee replacement
- 58 Health professionals' pain management decisions are influenced by their role (nurse or physician) and by patient gender, age and ethnicity

Nursing issues

- 59 Infection control practice: interview with 20 nurses reveals themes of rationalising their own behaviour and justifying any deviations from policy
- 60 Registered nurses, nurse specialists and physicians have a neutral to moderately positive view on nurse prescribing, though physicians still have patient safety concerns
- 61 High prevalence of neck, shoulder and back pain among nursing graduates warrants preventive strategies during the degree and into working life
- 62 Increasing nurse staffing levels and a higher proportion with bachelor's degrees could decrease patient mortality risk
- 63 Higher numbers of nurses and consultants improve survival rates for critically ill patients

Care of older people

- 64 Review: nurses predominantly have negative feelings towards the use of physical restraints in geriatric care, though some still perceive a need in clinical practice
