

Evidence-Based Nursing

Contents

Editorial

- 1 The case for specialist nurses

Research made simple

- 3 What is meta-analysis?

Resources

- 5 EBN resources page

Women's health

- 7 Pelvic floor muscle training may improve prolapse stage, muscle function and urinary symptoms compared to no training
- 8 European cost-effectiveness analysis of cervical screening strategies for women not vaccinated for HPV: in many scenarios primary HPV screening is preferable to primary cytology screening in women aged over 30 years
- 9 Women with viral STIs face dilemmas in negotiating condom use and would like direct safe sex advice from clinicians

Mental health

- 11 Cognitive behavioural group therapy is moderately effective for depression, with continued effect for up to 6 months but not beyond
- 12 Review of experimental and quasi-experimental studies finds that mindfulness-based interventions are more effective than standard care for reducing depressive symptoms in adults with mental disorders

Adult nursing

- 14 Addition of certain herbal medicines to chemotherapy may increase survival and quality of life in patients with advanced colorectal cancer
- 15 Adults with diabetes who perceive family members' behaviour as unsupportive are less adherent to their medication regimen

Child health

- 17 Breastfeeding duration not associated with average adiposity levels in 6-year-olds to 13-year-olds, but adequate breastfeeding may be associated with lower adiposity in the upper percentiles

January 2013 Vol 16 No 1

- 18 Longer duration of exclusive breastfeeding associated with reduced risk of childhood asthma up to age six

Health promotion

- 20 Physical training is well tolerated, leads to improvements in cardiopulmonary fitness and is not associated with adverse outcomes in people with asthma
- 21 Smoking cessation for hospitalised patients: intensive behavioural counselling started in hospital and continued after discharge increases quit rates; with additional benefit from adding nicotine replacement therapy
- 22 People with unhealthy lifestyle behaviours benefit from remote coaching via mobile technology
- 24 Ideal cardiovascular health in adolescence is associated with reduced risks of hypertension, metabolic syndrome and high cholesterol in adulthood
- 25 Greater intake of Western fast food among Singaporean adults is associated with increased risk of diabetes and heart-disease-related death

Nursing issues

- 27 Newly graduated Swedish nurses show a trend for increasing research use in the 5 years following qualification, with the trend starting after the second year
- 28 Patient perception of nurse-led chronic disease management varies depending on whether this was previously familiar to them
- 29 Swedish nursing students report that campus education supports research utilisation more than clinical education, but support varies between universities
- 31 The mental, physical and emotional health of newly qualified nurses may be influenced by their psychological capital and perceived job fit

Care of older people

- 33 Among elderly residents of long term care facilities, a visit to the emergency department is associated with an increased risk of acquiring a new respiratory or gastrointestinal infection
