Editorial

- 1 Are you brave enough Mr Hunt? Are you brave enough Mr Burnham?

Research made simple

- 2 Which statistical tests should I use?

Care of the older person

- 4 Exercise programmes for older people with dementia may have an effect on cognitive function and activities of daily living, but studies give inconsistent results
- 5 Older people identified by social services to be at risk of abuse have higher rates of hospitalisation
- 6 Family carers of people with cognitive impairment who are admitted to hospital experience disruption from their normal routine and use a variety of strategies to cope
- 7 Hospital discharge recommendations can be confusing for people of low socioeconomic status, and difficult to follow due to constraints or conflicting personal goals

Nursing issues

- 8 Emotional intelligence: enhancing value-based practice and compassionate care in nursing

Child health

- 9 Findings from qualitative studies suggest parents of children with disabilities benefit from peer support; whereas findings from quantitative studies are inconclusive
- 10 Evidence relating to the effectiveness of community-based interventions to improve the quality of life for children of parents with serious mental illness is weak; better quality studies are required
- 12 Transition from paediatric to adult care for chronic diseases may cause insecurity and unpreparedness for new relationships and surroundings
- 13 Adolescents of parents with chronic pain whose parents were 'shut off' report more hardship and feelings of distance than those with a more open relationship
- 14 A bottle-weaning counselling intervention for parents of 12-month-old infants reduces bottle use at age 24 months but has no effect on child weight
- 15 Exposure to selective serotonin reuptake inhibitors in late pregnancy increases the risk of persistent pulmonary hypertension of the newborn, but the absolute risk is low

January 2015 Vol 18 No 1

- 17 Among infants at hereditary risk for type 1 diabetes, the introduction of solid foods before or after 4–5 months of age is associated with increased diabetes risk

Adult nursing

- 18 People with coexisting diabetes, chronic kidney disease and hypertension report the psychosocial effects of being prescribed multiple medications
- 19 Sexual dysfunction common in people with coronary heart disease, but few cardiovascular changes actually occur during sexual activity
- 20 Early mobilisation after transfemoral catheterisation is not associated with increased vascular incidents, and reduces back pain
- 21 Patient participation in surgical treatment decision-making can be measured using a 16-item scale with four distinct dimensions
- 22 Elastic compression stockings fail to prevent post-thrombotic syndrome after a first deep vein thrombosis

Midwifery

- 23 Nepali women who are continuously supported by their husbands during labour are more likely to report greater postnatal support and lower levels of anxiety
- 24 Dutch midwives perceive a mixture of rewards and difficulties when caring for non-western women
- 25 At 15–20 weeks of pregnancy, various modifiable factors are associated with increased likelihood of a subsequent uncomplicated pregnancy
- 26 Small-for-gestational-age pregnancies are at cumulative increased risk of stillbirth for each week pregnancy continues beyond 37 weeks

Primary healthcare

- 27 A local public campaign reduces outpatient antibiotic prescribing in Italy
- 28 Diabetes risk increased between spouses
- 29 Obesity medications reduce total body weight by 3–9% compared with placebo, when combined with lifestyle changes

Mental health

- 31 People hospitalised on acute psychiatric wards report mixed feelings of safety and vulnerability

Women's health

- 32 Review: intimate partner violence is associated with termination of pregnancy
