

Evidence-Based Nursing

Contents

April 2011 Vol 14 No 2

Editorial

- 31 Leadership is key to ensuring evidence is used in practice

Adult nursing

- 32 Repeat invitations to non-attenders increase uptake of colorectal cancer screening; incidence screening continues to detect important cancers
- 33 Telephone follow-up does not significantly improve glycaemic control in type 2 diabetes overall, but more intensive programmes may have an effect
- 35 Higher consumption of sugar-sweetened beverages is associated with increased risk of developing type 2 diabetes or metabolic syndrome
- 36 A decision aid to support informed choice about bowel cancer screening in people with low educational level improves knowledge but reduces screening uptake

Care of the older person

- 38 Vitamin D reduces the risk of falls in older adults compared with calcium or placebo
- 39 Home-based biobehavioural intervention reduces dependence, increases engagement of patients with dementia in the short term and improves care giver wellbeing and confidence
- 40 Most hospices and palliative care programmes in the USA serve people with dementia; lack of awareness, need for respite care and reimbursement policies are the main barriers to providing this care
- 41 Listening to music gives some quality-of-life benefit to older people in a small 4-week trial from Hong Kong

Child Health

- 43 A telephone-based asthma management coaching programme improves QOL in parents of children with asthma, but has no effect on child's QOL or on use of urgent care

Health promotion

- 45 Nucleic acid amplification tests are more accurate and cost-effective than the Chlamydia rapid test for diagnosing genital chlamydia
- 46 Meta-analysis of before and after studies shows a 10% reduction in acute coronary events after introduction of comprehensive smoke-free legislation
- 47 Internet-based interventions for smoking cessation show inconsistent effects across trials, with only some trials showing a benefit

- 48 No clear evidence that hypnotherapy for smoking cessation is more effective in the long term than no treatment or other interventions
- 49 In individuals with poorly controlled diabetes, a reciprocal peer support programme gives greater 6-month improvement in HbA_{1c} than does nurse care management
- 50 A 3-year lifestyle intervention for adults at moderate to high risk of cardiovascular disease may be cost-effective when added to standard care and improves 3-year physical-function and bodily pain scores

Infection control

- 52 Rates of hospital-acquired and healthcare-associated MRSA declined in the USA between 2005 and 2008
- 54 Infection Probability Score shows 59.4% specificity and 74.3% sensitivity for predicting infection in haematology-oncology patients

Midwifery

- 55 Reducing the number of antenatal care visits in low-risk pregnancies increases perinatal mortality in low- and middle-income countries; women in all settings prefer the standard visit schedule

Nursing Issues

- 57 The style of nursing leadership in hospitals is an independent risk factor for 30-day mortality of patients in acute care
- 58 Available evidence does not support routine administration of antipyretics to reduce duration of fever or illness

Primary health care

- 60 Limited good-quality evidence available on earwax removal methods; softeners more effective than no treatment, but evidence for irrigation or mechanical removal is equivocal
- 61 Polyethylene glycol more effective than lactulose for relief of chronic constipation

Womens health

- 62 Clonidine, SSRIs, SNRIs and gabapentin reduce hot flashes in women with a history of breast cancer; relaxation therapy may have a mild effect in the short term
